You are cordially invited – Mark your calendars!

The reality of working with transboundary animal diseases: why do we need a multidisciplinary approach? The example of ASF in Europe.

Invited Speaker: Lina Mur, DVM, MSc, PhD

Research Assistant Professor,

Kansas State University
Dr. Mur’s primary research interest is in the epidemiology and control of Transboundary Animal Diseases (TADs), especially focused on African swine fever. Her research involves from the characterization of the disease in affected territories, risk assessments and spatial analysis, to the development of new reliable diagnostic methodologies. This multidisciplinary approach (involving field, laboratory and epidemiological studies) provides a global perspective for the design of better preventive, surveillance and control measures against TADs.
